Number of Rises _____

Stair Flight # _____

- A _____ Total Rise
- B _____ Total Run
- C _____ Tread Rise*
- D _____ Tread Depth* (nose to Nose)
- E _____ Nose Depth
- F _____ Tread Offset
- G _____ Tread Thickness
- H _____ Pitch or Angle*
- I _____
- J _____
- K _____
- L _____

Measurements: Very carefully measure the stair and fill in this form.

*Measurement C,D and H are the most critical to ensure proper railing fit. See measuring guidelines on the next page for help.

Photos: Photos of the site from numerous angles are required for use to get a better idea of the site conditions. These can be emailed to Dan@Keuka-Studios.com

Stair Measurement - Guidelines

Measuring Stair Rise and Run: Measuring stairs is relatively easy if you follow the steps below. Measure these carefully. Errors in measurements are magnified (accumulate with each step). Often these measurements vary from tread to tread (especially at the top and bottom step).

Step 1. Use a framing square and a ruler or straightedge to determine the exact height of each tread rise. Record on attached chart for each tread. Start at the lower floor and work your way up.

Step 2. Using 2 squares determine the exact nose to nose run of each tread, record on the worksheet.

Method 2 - Digital Angle

An inexpensive and precise method for measuring stairs (and a great way to double check your measurements) is to use a digital level. Home depot sells them for about 35\$ or if you have a smart phone you can download a digital level app. See links below..

Android phones: <https://play.google.com/store/apps/details?id=com.plaincode.clinometer&hl=en>

Apple phones: <https://itunes.apple.com/us/app/clinometer-+-bubble-level/id286215117?mt=8>

Be sure to lay the digital level across a number of treads using a straight edge (very straight board or a long level). You will still need to supply us with a few tread rise measurements and the overall number of rises for this method to work.
